

The project “Magic of Nature” is part of the year-round training of 7th grade students “Biology - interesting and useful.” The main objective of the project is to meet the educational and informational needs arising as a result of the reforms taking place in Bulgarian education, as well as in relation to public interest in issues related to the protection of the environment and the rational use of its resources.

During the week from May 30 to June 5, 2019, students from 7th grade will conduct a study of the healing and beneficial properties of herbaceous plant species in the north-western region of Bulgaria and produce panels that will be placed in a prominent place in the school. The celebration of the Bulgarian national holiday of Enyovden will be marked under the motto "The charm of flowers and herbs." Pupils will prepare thematic presentations on the nutritional qualities of superfruits and alternative products. The focus is on what nature has created, adapting it through the prism of modern technology to the needs of human society.

Pupils will take part in a practical class on maintaining colored arrays in the schoolyard.

Expected results:

- Formation of an active civil attitude to the state of the environment and intolerance to its damage by improving the quality of their environmental education and increasing the overall ecological culture.
- Enhancing the participation of young people in public life in terms of environmental protection based on a new model of the relationship between them and nature;
- Application of knowledge and practical skills to protect the environment at school and beyond;
- Emotional involvement of students in issues of ecology and education in debt and responsibility to nature and the future of mankind;
- Formation of teamwork skills, dialogue and discussion of opinions and suggestions.
